

Technical Data Sheet

Neodymium Disc Magnets, N35, Plated, High Temp

Neodymium magnets are part of the Rare Earth magnet family and are the most powerful permanent magnets in the world. They are referred to as NdFeB magnets, or NIB, because they are composed of Neodymium (Nd), Iron (Fe) and Boron (B). Bring on the Heat! These magnets can safely be used at operating temperatures up to 300° Fahrenheit (149° Celsius) – depending on the magnetic circuit. Call for technical advice. These can be used in oil filters – to separate any iron fillings or metal chips.

Product Specifications

| | |
|------------------------------------|--------------------|
| Shape: | Disc |
| Tolerance: | .005 |
| Material: | NdFeB |
| Plating: | Ni |
| Max. Operating Temperature: | 300°F/149°C |
| Br. Max: | 12150 |
| BH Max: | 35 |

| Part No. | Diameter | Thickness | Holding Force(lbs) | Price |
|--------------|----------|-----------|--------------------|--------|
| N35P118060HT | 0.118 | 0.060 | 0.5 | \$0.50 |

- All Measurements are in inches (unless otherwise noted)
- Direction of Magnetization (DOM) is through the thickness unless noted
- Unless otherwise specified, magnets will be furnished in magnetized condition
- Holding forces are approximate. These are average values obtained under laboratory conditions. Size, shape, and material of the test piece may affect actual pull forces
